AGRICULTURAL COMMODITY PRODUCTION AND YIELD TRENDS:

1950 TO 1975

by Forrest D. Holland

Trends in production and yield are of interest to policy planners in domestic agricultural programs and agricultural trade. Data just recently available makes possible the estimation of long-run trend yield and production relationships. The results of trend estimation for several commodities and regions for the 26 years 1950 to 1975 are presented in this paper.

A linear time trend equation of the form

$$Y = \alpha + \beta t + \epsilon$$

Y = yield (mt./ha.) or production (m.m.t.),

t = 1 to 26 (1950 to 1975),

was estimated with OLS for each commodity and region (see table 1). As expected, the fit as indicated by \bar{R}^2 improves with aggregation since fluctuations within smaller regions tend to offset each other. Detailed OLS trend estimation results are presented in tables 2 to 12.

The statistics presented in tables 2 to 12 are conventional. The regression parameters $\hat{\alpha}$ and $\hat{\beta}$ are respectively the estimated intercept and slope. $T(\hat{\beta})$ is the T value $\hat{\beta}$ divided by the estimated standard error of $\hat{\beta}$ and the overall F statistic may be obtained by squaring the T value. \bar{R}^2 is the proportion of explained to total variation and S.E. is the standard error of the $\hat{\epsilon}$ vector. The Durbin-Watson (D.W.) is an indicator of autocorrelation. The critical D.W. value for one explanatory variable and 26 observations is 1.19 with inconclusive region 1.19

to 1.35. The mean absolute deviation (M.A.D.) is the average deviation from estimated trend irrespective of sign. Maximum +Dev and -Dev are the largest positive and negative deviations from the estimated trend line within the fit period. The last column of the production trend tables is simply that region's percentage of world production during the three years 1973 to 1975.

Some of the Durbin-Watsons are very low; for example, the trend production equation for U.S.S.R. rice has a D.W. less than 0.1. To a large extent this D.W. reflects misspecification. An examination of U.S.S.R. rice production data indicates that a growth trend $Y = Y_0(1+r)^t$ is more appropriate. In general, a low D.W. may be indicative of improper specification, and growth trend specification should be considered.

The trend equations were estimated by regions, thus residual correlations across commodities within a region were easily obtained. The residual correlation matrices of trend production and yield for the world and the United States are presented in tables 13 and 14. These correlations refer to the deviations from estimated trend, and are interpreted as a measure of linear association.

Actual production and yields, and the estimated linear trend line for all commodity groups for the world and United States are illustrated in plots 1 through 44.

The data used in estimation^{1/} as well as means and standard deviations are reproduced as tables 15 to 34.

^{1/}Data source: ERS data tape.

Table 1
Agricultural Commodity Groups and World Regions

<u>Groups</u>				
1.	Wheat			
2.	Rice			
3.	Food grain (wheat and rice)			
4.	Corn			
5.	Barley			
6.	Oats			
7.	Sorghum-Millet			
8.	Feed grain (corn, barley, oats, and sorghum-millet)			
9.	Rye			
10.	Coarse grain (corn, barley, oats, sorghum-millet, and rye)			
11.	Cereals (wheat, rice, corn, barley, oats, sorghum-millet, and rye)			

<u>Regions</u>				
1.	World			
2.	World less United States			
3.	United States			
4.	Canada			
5.	European Economic Community (E.E.C.):			
	Belgium	Luxemborg	Denmark	
	France	West Germany	Ireland	
	Italy	Netherlands	United Kingdom	
6.	Other Western Europe (O.W.E.):			
	Austria	Norway	Portugal	Spain
	Sweden	Switzerland	Finland	
	Greece	Iceland	Malta	
7.	Total Developed:			
	United States	Canada	E.E.C.
